OF FINLAND

# More with less – the Finnish collaboration model

Collaborative data collection enabling  
evidence-based decision making and  
innovation + Some ways forward

Jani Kylmäaho

*Chief Digital Officer*

*National Land Survey of Finland*

# Finland - geographical challenges

## Finland in a nutshell

- 390 000 km<sup>2</sup> (forested areas 77 %)
- 64<sup>th</sup> largest country in the world – lots of data needed to cover the whole country
- Bordering countries
  - Norway
  - Sweden
  - Russia (**1340 km** borderline)
- Between 60' and 70' latitudes
- Weather conditions often challenging for data acquisition - clouds, snow

Image: Geoportal Arctic-SDI

An aerial photograph of a lush, green landscape. A dark, winding river flows through the center, surrounded by dense forests. To the right, a large, dark lake is visible. The terrain is hilly, and there are some small buildings and roads scattered throughout the forested areas.

**KALLIO =**

National lidar and aerial image programs.

Collaboration between organizations in the Finnish public sector on acquisition and processing of remote sensing data.

---

# Together.

5 public organizations are planning, funding and implementing the data acquisition together:

- NLS Finland
- Finnish Forestry Centre
- Finnish Forest Agency
- Finnish Food Authority
- Finnish Environment Institute

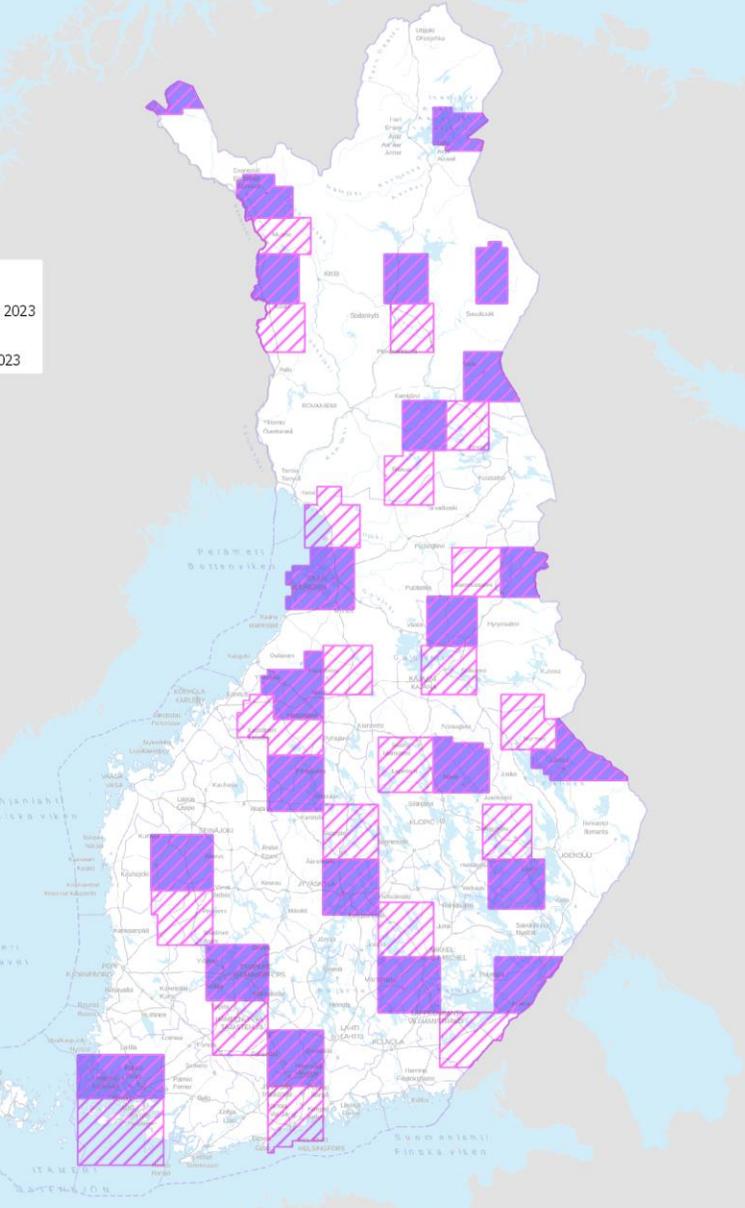

The new model of collaboration was first launched in 2020.

These organizations are not only sharing the data but also different kind of **know-how**.

The KALLIO collaboration builds **trust** between the member organizations. Trust has been boosting even more co-operation between the organizations, such as common development projects.

Laserkeilaukset  
Laserkeilaus 2023

---

# More.

The National Aerial Image Program: 3 year interval, 50 cm orthophotos.

The National Lidar Program: 6 year interval, 5 points/m<sup>2</sup> resolution.

Use Cases of the data by KALLIO collaboration organizations are for example:

- production and updating forest data
- regulating agricultural subsidies and forest law
- flood mapping
- updating the national topographic database

# With less.

None of the KALLIO organizations could afford to acquire all the aerial image and/or lidar data by themselves – the data acquisition costs approximately **4,3 million euros** per year!

NLS Finland is the expert and operative lead of the collaboration:

- Procurements, project lead and own data acquisition
- Quality control of the data
- Data security issues
- Data delivery and archiving.

Other organizations can trust the data quality and concentrate on their own work - not on data acquisition issues.

Large procurements also keep the costs (€/km<sup>2</sup>) reasonable!

# Co-operation that benefits the private sector as well

- Interesting business opportunities for private contractors in data acquisition
  - 60 000 km<sup>2</sup> Lidar data and 110 000 km<sup>2</sup> aerial photos / year
  - 2022: 5 companies working in 2 framework agreements (aerial imagery and lidar)
- All data as public data - to boost research and private innovation

# Developing a Common Knowledge Base for Monitoring Land Use and its Changes - Project Partners

Finnish Environment Institute

National Land Survey of Finland

Natural Resources Institute Finland

Finnish Food Authority

Finnish Forest Centre

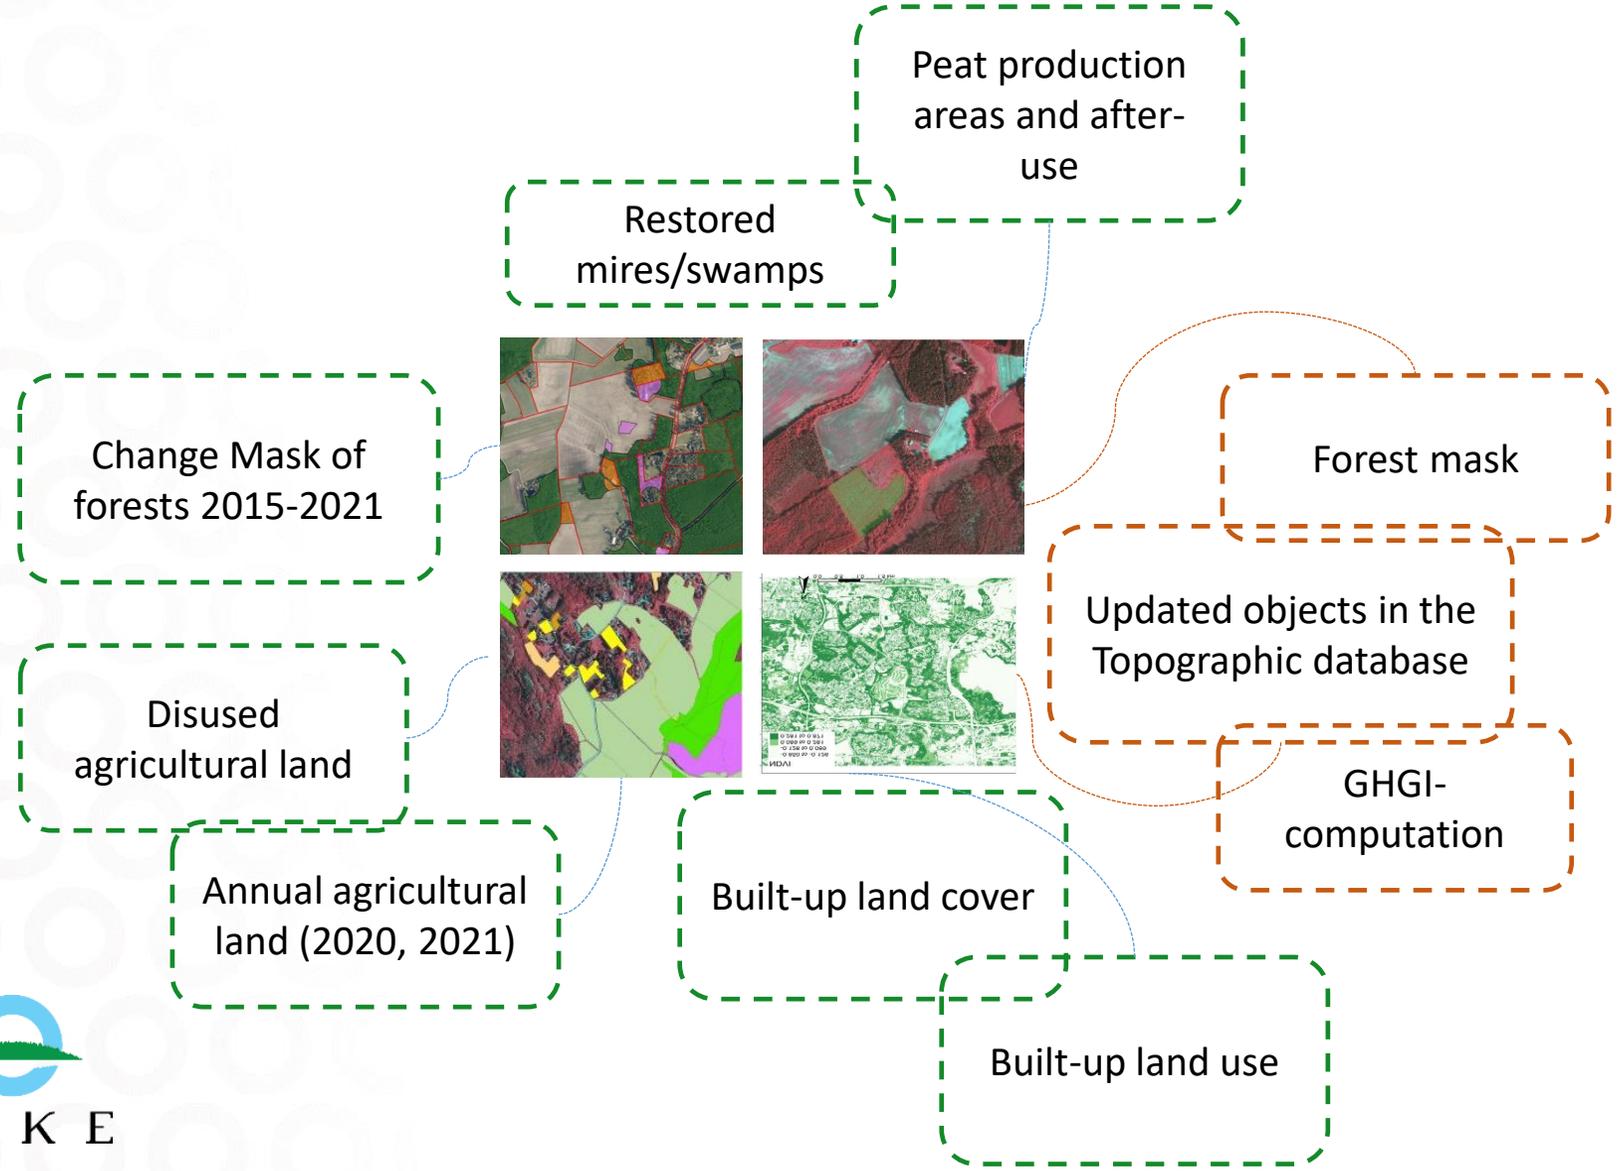

*Project Duration: 2021-2023*

## Developing a Common Knowledge Base for Monitoring Land Use and its Changes - Project Goals:

- Improve the **Geospatial Knowledge Base** describing land use and its changes as a basis for reporting, planning, monitoring and decision-making regarding land use
- Produce data sets describing land use and its changes, **combining and further processing data produced by different actors**
- Develop a **common governance model for land use data production**, to enable regular monitoring of land use and its changes

# Project Results

- **Governance model:** Proposal for roles and responsibilities for different organizations for the production and maintenance of data sets
- **Development proposals:** for the materials and processes used by the project

# Issue? Market disturbance

- The Competition Authority (in Finland) has relatively strict interpretation on what authorities can do without risk of disturbing the market..

Current interpretation:

**NLS is not allowed to sell products or consultation services** that can be provided by the private sector (unless specifically mandated by law).

2026 ->. EVEN MORE?

The first KALLIO program will end 2025 with whole of Finland lidar coverage in 5 points/m<sup>2</sup> (and 50cm aerial twice).

**A new KALLIO program is under planning** to be launched starting 2026.

The goal is to expand the KALLIO collaboration to involve more organizations and to collect more detailed data.

Planned datasets include point density of 20 points/m<sup>2</sup> (laser scanning) and aerial images with resolution of 20 centimeters.

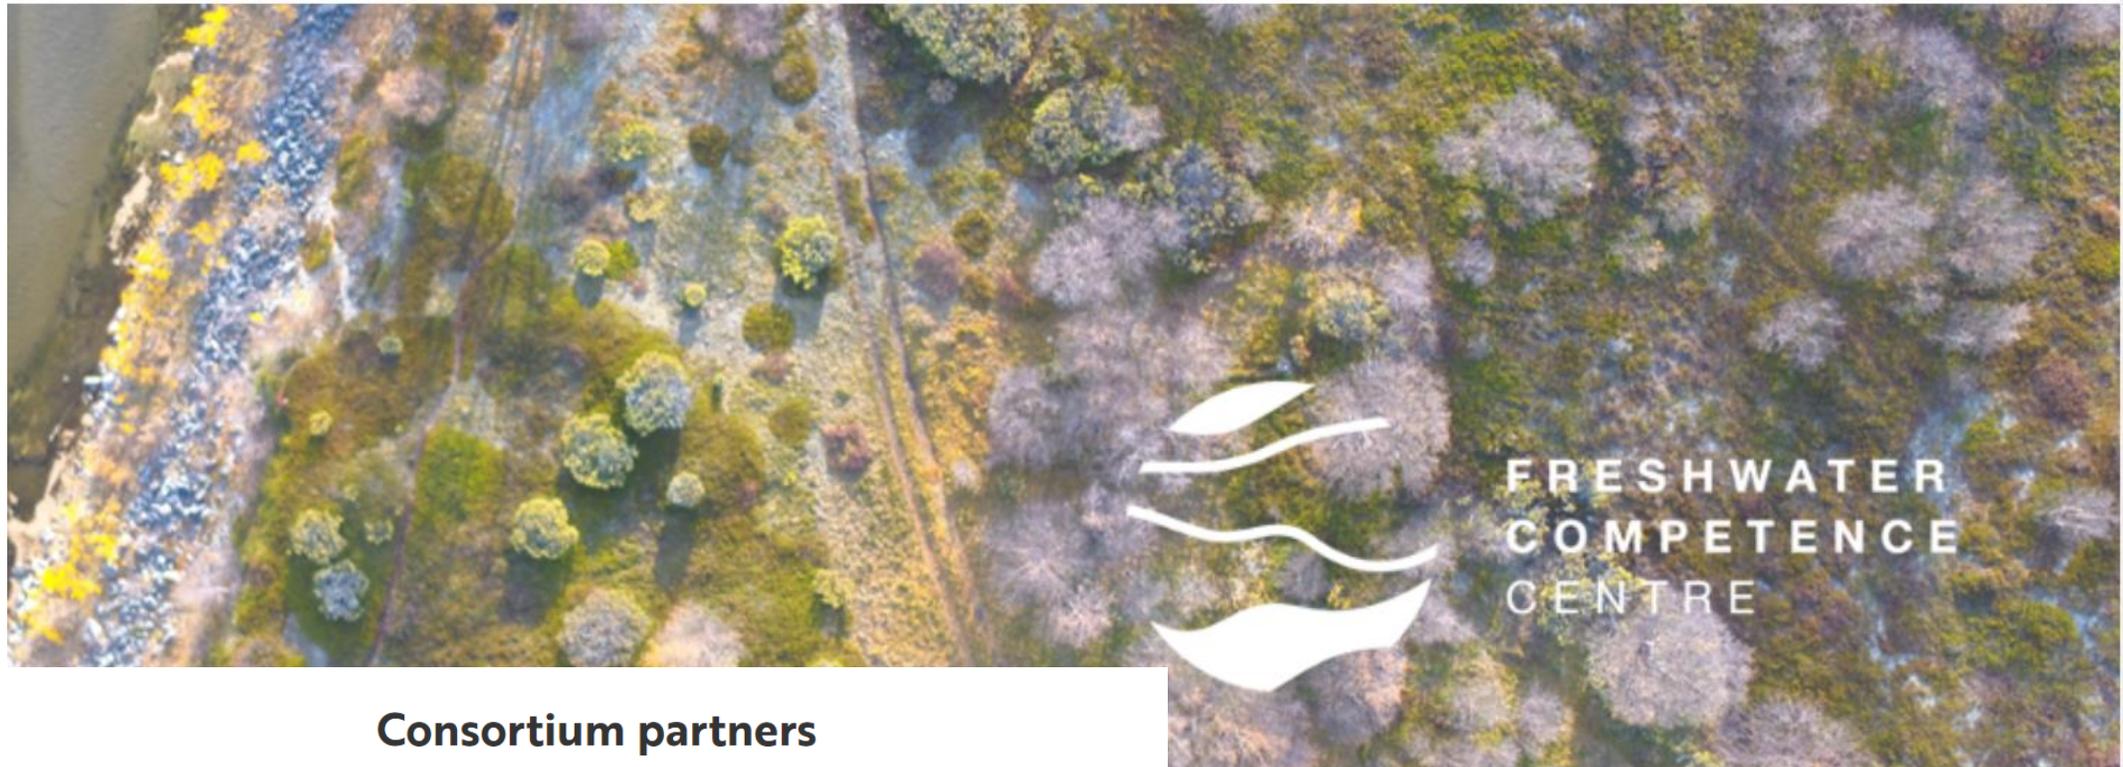

With detailed datasets and information there are more use cases, such as:

- Digital Twin of Forests
- Carbon sink & other Green Deal analysis
- Digital Twins / Smart cities/municipalities
- Digital Twin of Freshwater network
- Digital Twin of Traffic infrastructure
- Metaverse applications
- Other Data ecosystems and Data Spaces??

**Finpeda Virtual Space (FVS) takes training and business meetings to metaverse in minutes with use of avatars, 3D assets and real-time content sharing.**

# Multiuser collaborative virtual space

finpeda virtual space  
IMMERSIVE LEARNING EXPERIENCE

✓ Supports distance presence

✓ Visual access through maps

✓ Combines physical and virtual worlds

# Common European data spaces

Rich pool of data  
(varying degree of  
accessibility)

Free flow of data  
across sectors and  
countries

Full respect of GDPR

Horizontal  
framework for data  
governance and data  
access

Health

Industrial &  
Manufacturing

Agriculture

Finance

Mobility

Green Deal

Energy

Public  
Administration

Skills

- Technical tools for data pooling and sharing
- Standards & interoperability (technical, semantic)

- Sectoral Data Governance (contracts, licenses, access rights, usage rights)
- IT capacity, including cloud storage, processing and services

# Location for European Data Spaces

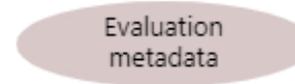

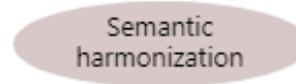

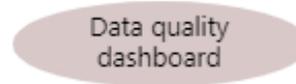

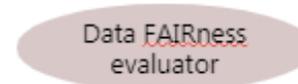

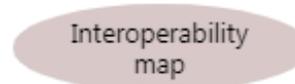

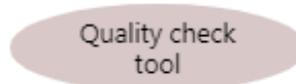

## Project concept v1

DRAFT

### LOCATION FOR EUROPEAN DATA SPACES

The purpose is to make national geospatial data available as part of European data spaces, thus enabling and driving the use of national high value data sets in developing internationally scalable, integrated digital services for the European citizen

**Goal 1:** Develop a data space connecting framework and tools that enable utilization of organization's own (business) data combined with a high value data set (such as geospatial, statistical, environmental observation and meteorological data)

**Goal 2:** Suggest a business model for operating the framework and tools in the future, as a service provider for the data spaces

**Goal 3:** Demonstrate combining high value data sets with geospatial data through example use cases

# Takeaways

Digital Transformation is not just about leveraging new technology – it is about new collaboration models for creating more value and impact with stakeholders.

Development of more mature Digital Twins in various data ecosystems and the immersive Metaverse applications drive the need for geospatial data development, further interoperability measures and collaboration to reduce cost.

**Building Collaboration and Trust across silos and sectors is key to success of NMCA's!**

# Thank you!
